# Pallet Bar Restraint System

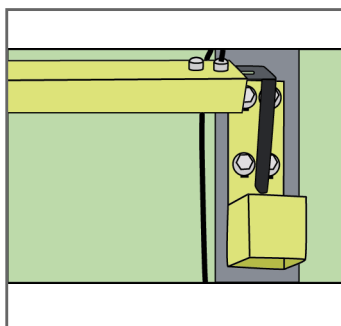

PBA 94Y

## PRODUCT FEATURES

- Keeps wrapped pallet loads contained on warehouse shelving
- Can be lifted and removed without special equipment
- Allows easy removal and replacement of pallets
- Quick installation, simply bolt the shoe bracket to the rack framing
- Safety cable to prevent restraint bar from falling while loading and unloading

Adjustable safety cable

Close up of shoe bracket and drop pin

Manual operation

Mechanical operation

The Pallet Bar Restraint System is specifically designed to protect your warehouse investment and warehouse workers in case of an earthquake. The Pallet Bars keep pallets on warehouse shelving from sliding forward and falling during seismic activity.

Pallet Bars can be lifted and removed by a fork lift operator or manually without special equipment. Safety cable is adjustable so Pallet Bar can be lowered just below the rack beam for access to the pallet. Stainless steel drop pin prevents paint damage.

This system assumes that the shelving system uprights have been properly anchored to the concrete floor, and that the shelving system is structurally sound. It also assumes loose items on pallets have been either strapped or shrink wrapped directly to the pallet.
